Statistical Analysis of Economic Growth and Its Determinants in India

Data Source: World Bank World Development Indicators (WDI)

Country: India (Code: IND)

Analysis Period: 1991–2025 (35 annual observations)

Executive Summary & Key Findings

• **Dataset & Scope:** Analysis covers 35 annual observations for India (1991–2025) sourced from the World Bank WDI, examining GDP Growth alongside five explanatory macroeconomic determinants (Inflation, FDI Net Inflows, Exports, Gross Capital Formation, and Unemployment).

• **Descriptive Characteristics:** Summarizes central tendency and dispersion across all indicators over the study period (e.g., mean GDP Growth = 6.14%, median = 7.10%, std dev = 2.80%, range = -5.78% to 9.69%).

• **Distribution & Normality:** Shapiro-Wilk and Anderson-Darling tests evaluate distribution properties; 2 of 6 variables show no evidence against normality at $\alpha = 0.05$, while GDP Growth, Inflation (CPI), Exports, Unemployment exhibit empirical non-normality.

• **Correlation Structure:** Pairwise analysis evaluates linear (Pearson) and monotonic (Spearman) relationships with GDP Growth; the strongest positive linear association is with Gross Capital Formation ($r = 0.3180$, $p = 0.0626$), and strongest negative is with Unemployment ($r = -0.2095$, $p = 0.2270$).

• **Multiple Linear Regression (OLS):** Fits GDP Growth on all five predictors, accounting for 28.37% of the sample variance ($R^2 = 0.2837$, Adjusted $R^2 = 0.1602$, overall F-statistic = 2.2969, $p = 0.0710$).

• **Robust HC3 Inference:** Employs heteroskedasticity-consistent HC3 standard errors for inference, identifying 0 statistically significant predictor(s) at $\alpha = 0.05$ (none).

• **Econometric Diagnostics:** Tests confirm no strong evidence of first-order autocorrelation (Durbin-Watson = 1.744), no statistically significant heteroskedasticity at $\alpha = 0.05$ (Breusch-Pagan $p = 0.1222$), residual non-normality (Shapiro-Wilk $p = 0.0040$), 2 observation(s) exceeding $4/n \approx 0.114$ Cook's Distance screening threshold (1991, 2020), and maximum VIF = 5.71 (Exports).

• **Methodological Caution:** All observed relationships represent conditional empirical associations in observational time-series data and do not imply causal mechanisms.

1. Descriptive Statistics

Summary statistics for annual macroeconomic variables in India (1991–2025, n = 35):

Variable	Count	Mean	Median	Std Dev	Min	Max	Range	Q1	Q3	IQR	Skewness	Excess Kurtosis
GDP Growth	35	6.14	7.10	2.80	-5.78	9.69	15.47	5.03	7.86	2.83	-2.49	8.85
Inflation (CPI)	35	6.89	6.33	3.11	2.40	13.87	11.47	4.27	9.23	4.96	0.69	-0.60
FDI Net Inflows	35	1.26	1.06	0.80	0.03	3.62	3.59	0.67	1.74	1.07	0.75	0.74
Exports	35	17.64	19.16	5.41	8.49	25.43	16.94	12.01	22.16	10.16	-0.36	-1.35
Gross Capital Formation	35	32.10	32.12	5.17	22.72	41.95	19.23	29.04	34.85	5.81	0.00	-0.80
Unemployment	35	7.18	7.61	1.07	4.17	7.86	3.69	7.56	7.64	0.08	-2.30	3.91

2. Probability & Distribution Analysis

Parametric distribution characteristics and formal tests for normality:

Variable	Shapiro-Wilk Stat	Shapiro-Wilk p	Anderson-Darling Stat	Skewness Shape	Kurtosis Shape	Normality Decision (α = 0.05)
GDP Growth	0.7735	< 0.0001	1.9705	Negatively Skewed (Left-tailed)	Leptokurtic (Heavy-tailed/Peaked)	Evidence of non-normality at α = 0.05
Inflation (CPI)	0.9196	0.0139	1.0397	Positively Skewed (Right-tailed)	Platykurtic (Light-tailed/Flat)	Evidence of non-normality at α = 0.05
FDI Net Inflows	0.9545	0.1554	0.4367	Positively Skewed (Right-tailed)	Leptokurtic (Heavy-tailed/Peaked)	No evidence against normality at α = 0.05
Exports	0.9034	0.0049	1.2682	Symmetric	Platykurtic (Light-tailed/Flat)	Evidence of non-normality at α = 0.05
Gross Capital Formation	0.9691	0.4193	0.3246	Symmetric	Platykurtic (Light-tailed/Flat)	No evidence against normality at α = 0.05
Unemployment	0.5024	< 0.0001	8.2095	Negatively Skewed (Left-tailed)	Leptokurtic (Heavy-tailed/Peaked)	Evidence of non-normality at α = 0.05

3. Correlation Analysis

Pairwise correlation evaluates linear (Pearson r) and monotonic (Spearman rho) relationships across the macroeconomic indicators. Associations with GDP Growth:

• Inflation (CPI) shows no statistically significant association with GDP Growth under either Pearson (r = -0.1412, p = 0.4184) or Spearman (rho = -0.1331, p = 0.4461) measures at α = 0.05.

• FDI Net Inflows shows no statistically significant association with GDP Growth under either Pearson (r = -0.1189, p = 0.4962) or Spearman (rho = 0.1090, p = 0.5332) measures at α = 0.05.

• Exports shows no statistically significant association with GDP Growth under either Pearson (r = 0.1930, p = 0.2665) or Spearman (rho = 0.2308, p = 0.1822) measures at α = 0.05.

• Gross Capital Formation exhibits a statistically significant rank correlation (Spearman rho = 0.4305, p = 0.0098 < 0.05), while its linear association is not statistically significant (Pearson r = 0.3180, p = 0.0626 ≥ 0.05), indicating a monotonic rather than strictly linear association.

• Unemployment exhibits a statistically significant rank correlation (Spearman rho = -0.3751, p = 0.0264 < 0.05), while its linear association is not statistically significant (Pearson r = -0.2095, p = 0.2270 ≥ 0.05), indicating a monotonic rather than strictly linear association.

Pairwise Relationships Table

Variable 1	Variable 2	Pearson r	Pearson p	Spearman rho	Spearman p	N Obs	Relationship	Significant (5%)
GDP Growth	**Inflation (CPI)**	-0.1412	0.4184	-0.1331	0.4461	35	Negative Very Weak / None	No
GDP Growth	**FDI Net Inflows**	-0.1189	0.4962	0.1090	0.5332	35	Negative Very Weak / None	No
GDP Growth	**Exports**	0.1930	0.2665	0.2308	0.1822	35	Positive Very Weak / None	No
GDP Growth	**Gross Capital Formation**	0.3180	0.0626	0.4305	0.0098	35	Positive Weak	Yes
GDP Growth	**Unemployment**	-0.2095	0.2270	-0.3751	0.0264	35	Negative Weak	Yes
Inflation (CPI)	**FDI Net Inflows**	-0.0940	0.5911	-0.0950	0.5874	35	Negative Very Weak / None	No
Inflation (CPI)	**Exports**	-0.2212	0.2016	-0.0401	0.8193	35	Negative Weak	No
Inflation (CPI)	**Gross Capital Formation**	-0.0957	0.5844	-0.0717	0.6823	35	Negative Very Weak / None	No
Inflation (CPI)	**Unemployment**	0.2869	0.0947	0.2320	0.1800	35	Positive Weak	No
FDI Net Inflows	**Exports**	0.6956	< 0.0001	0.6787	< 0.0001	35	Positive Strong	Yes
FDI Net Inflows	**Gross Capital Formation**	0.6248	< 0.0001	0.6118	< 0.0001	35	Positive Strong	Yes
FDI Net Inflows	**Unemployment**	0.1113	0.5246	0.1182	0.4988	35	Positive Very Weak / None	No

Variable 1	Variable 2	Pearson r	Pearson p	Spearman rho	Spearman p	N Obs	Relationship	Significant (5%)
Exports	**Gross Capital Formation**	0.8249	< 0.0001	0.8255	< 0.0001	35	Positive Very Strong	Yes
Exports	**Unemployment**	-0.3506	0.0389	-0.0826	0.6369	35	Negative Weak	Yes
Gross Capital Formation	**Unemployment**	-0.1558	0.3713	-0.1399	0.4227	35	Negative Very Weak / None	No

4. Multiple Linear Regression Model (OLS)

Dependent Variable: `GDP Growth`

Independent Variables: `Inflation (CPI), FDI Net Inflows, Exports, Gross Capital Formation, Unemployment`

Estimated Equation: `GDP Growth = -1.4683 − 0.1118 × Inflation (CPI) − 1.8629 × FDI Net Inflows + 0.0093 × Exports + 0.3362 × Gross Capital Formation − 0.0316 × Unemployment`

- **R-squared:** 0.2837
- **Adjusted R-squared:** 0.1602
- **F-statistic:** 2.2969 (p-value = 0.0710)
- **Residual Standard Error:** 2.5695
- **Sample Size (N):** 35 complete annual observations

Regression Coefficients Table (HC3 Robust SE)

Variable	Coefficient	HC3 Robust SE	t-statistic	p-value	95% CI Lower	95% CI Upper	Significant (5%)
Intercept (Constant)	-1.468261	5.243594	-0.2800	0.7815	-12.1926	9.2561	No
Inflation (CPI)	-0.111795	0.149001	-0.7503	0.4591	-0.4165	0.1929	No
FDI Net Inflows	-1.862890	1.285579	-1.4491	0.1580	-4.4922	0.7664	No
Exports	0.009283	0.149119	0.0623	0.9508	-0.2957	0.3143	No
Gross Capital Formation	0.336227	0.216727	1.5514	0.1317	-0.1070	0.7795	No
Unemployment	-0.031613	0.334334	-0.0946	0.9253	-0.7154	0.6522	No

OLS vs HC3 Robust Standard Errors Comparison

Variable	OLS Coef	OLS SE	OLS p-value	HC3 SE	HC3 p-value	SE Change (%)	HC3 Significant (5%)
Intercept (Constant)	-1.468261	5.195162	0.7795	5.243594	0.7815	+0.93%	No
Inflation (CPI)	-0.111795	0.150015	0.4621	0.149001	0.4591	-0.68%	No
FDI Net Inflows	-1.862890	0.907512	0.0492	1.285579	0.1580	+41.66%	No
Exports	0.009283	0.194612	0.9623	0.149119	0.9508	-23.38%	No
Gross Capital Formation	0.336227	0.156632	0.0403	0.216727	0.1317	+38.37%	No
Unemployment	-0.031613	0.538356	0.9536	0.334334	0.9253	-37.90%	No

5. Regression Diagnostics

Econometric verification of classical linear regression model assumptions:

Diagnostic Tests Summary

Test	Statistic	p-value	Decision / Status	Interpretation
Durbin-Watson Autocorrelation	1.7440	N/A	No strong evidence	DW = 1.744; the statistic is reasonably close to 2.0, suggesting no strong evidence of first-order autocorrelation.

Test	Statistic	p-value	Decision / Status	Interpretation
Breusch-Pagan Heteroscedasticity	8.6870	0.1222	Fail to reject H■	No statistically significant evidence of heteroskedasticity at α = 0.05.
Shapiro-Wilk Residual Normality	0.9001	0.0040	Reject H■	Evidence of non-normality in residuals at α = 0.05.
Cook's Distance (Influential Points)	0.6130	N/A	2 Exceeding Obs.	2 observation(s) (1991, 2020) exceed the Cook's D screening threshold (4/n ≈ 0.114). Retained to maintain full macro sample integrity.

Variance Inflation Factors (VIF)

Predictor Variable	VIF	Screening Guideline / Status
Inflation (CPI)	1.1243	Low concern (VIF < 5)
FDI Net Inflows	2.6905	Low concern (VIF < 5)
Exports	5.7055	Potential concern (5 ≤ VIF < 10)
Gross Capital Formation	3.3786	Low concern (VIF < 5)
Unemployment	1.7242	Low concern (VIF < 5)

6. Discussion & Methodological Cautions

1. **Descriptive Characteristics & Macroeconomic Volatility:** Over the study period, India's annual GDP Growth averaged 6.14% with a standard deviation of 2.80%, ranging between -5.78% and 9.69%. This variability reflects substantial macroeconomic structural transitions, policy shifts, and external economic shocks.

2. **Distributional Shapes & Robust Estimation:** Statistical normality testing reveals that 2 of 6 variables exhibit standard normal properties, whereas GDP Growth, Inflation (CPI), Exports, Unemployment deviate from univariate normality. Furthermore, OLS residual testing yields Shapiro-Wilk p = 0.0040, indicating residual non-normality. Consequently, relying strictly on classical OLS standard errors could distort hypothesis tests; using HC3 Robust Standard Errors provides asymptotically valid, heteroskedasticity-consistent inference.

3. **Correlation vs. Regression Performance:** Pairwise linear and rank correlations identify bivariate associations with GDP Growth, most notably with Gross Capital Formation (r = 0.3180) and Unemployment (r = -0.2095). The multiple OLS regression model accounts for 28.37% of the overall variance in GDP Growth (R^2 = 0.2837, Adjusted R^2 = 0.1602), with an overall model F-statistic of 2.2969 (p = 0.0710).

4. **Econometric Diagnostics & Multicollinearity:** Autocorrelation diagnostics yield Durbin-Watson = 1.744, suggesting no strong evidence of first-order serial correlation. Breusch-Pagan testing (p = 0.1222) indicates no statistically significant evidence of heteroskedasticity at α = 0.05. Cook's Distance identifies 2 observation(s) (1991, 2020) exceeding the screening threshold (4/n ≈ 0.114), which correspond to major historical macroeconomic shocks rather than data transcription errors. Variance Inflation Factors remain within standard screening bounds (maximum VIF = 5.71 for Exports), confirming no severe multicollinearity.

5. **Methodological Cautions & Limitations:**

• *Association vs. Causation:* All reported correlation and regression coefficients quantify conditional empirical associations; they do not establish causal relationships or structural policy mechanisms.

• *Sample Size & Time-Series Constraints:* The dataset comprises 35 annual time-series observations (1991–2025). Time-series data are subject to structural breaks (e.g., 1991 economic reforms, 2008 global financial crisis, 2020 COVID-19 pandemic) and non-stationarity.

• *Model Specification & Omitted Variables:* Estimated parameters reflect the five specified macroeconomic indicators. Omitted macroeconomic variables (e.g., monetary policy stance, fiscal deficits, exchange rates, global energy prices) may influence estimated coefficients.

• *Diagnostic Interpretation:* Econometric screening tests (DW, BP, Shapiro-Wilk, VIF) provide heuristic diagnostic evidence rather than absolute mathematical certainty.
